

Catching Rainwater

... continued from page D1

The Board say it depends on the quality of the water, for which the board does not currently test, and the safety of its catchment and storage facilities, as well as the length of time the water spends in the tank.)

The use of any water – especially watching the skies pour down in March and April – has many Lamorindans starting to use rainwater catchment systems, so that when the rain comes down, it doesn't just flow downhill or seep into the ground. Instead it gets caught up in barrels and tanks and troughs so that livestock, gardens and even toilets get water targeted for a purpose, and doesn't come through East Bay Municipal Utility District's metered system.

"We use it for a lot of things," Lawrence said. "We have rain barrels coming down right in front of the gutters."

In many parts of Colorado, catching rainwater is illegal. Ranchers and farmers need all the runoff from suburban and borderline properties to flow off the roofs of houses and into the watershed. Many families find it abhorrent that the rain that falls on their roofs is owned by somebody else. Such conflicts illustrate that water is becoming a more politicized issue.

Less than 3 percent of all the water on earth is fresh water. That is correct: less than 3 percent. Predictably, in a drought the precious amount of rainwater is being harvested by more households in order to water gardens, trees, or even for drinking.

"We drink rainwater here, too" Jones said.

Jones even put a metal roof on her house to ensure more "clean" delivery into the directed rain gutters on the part of the house that rain showers feed most directly into her big tank. She waters a garden and fruit trees, and waters her livestock and birds. "It's pretty simple," she said.

For more information on rainwater catchment systems, visit the American Rainwater Catchment Systems Association at www.arcsa.org.
